

This presentation will discuss these critical points of project schedule and cost control components:

- What is schedule and cost control and why do we need it?
- How does the project relate to the business strategy?
- Requirements definition and development
- Project planning
- Project monitoring and control
- Project Closeout

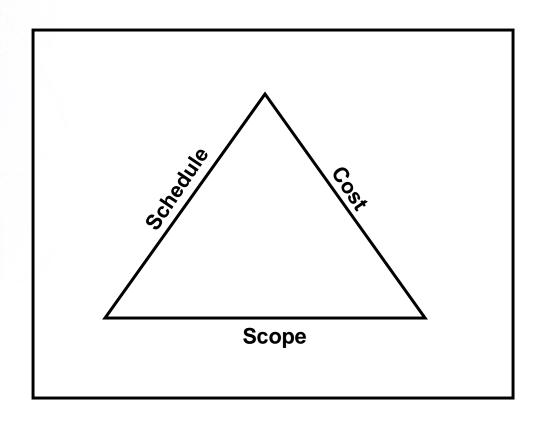

What is Schedule and Cost Control?

The practice of Schedule and Cost Control can be summarized by these four project management actions:

- Directing progress
- Directing actions
- Controlling results
- Conserving resources

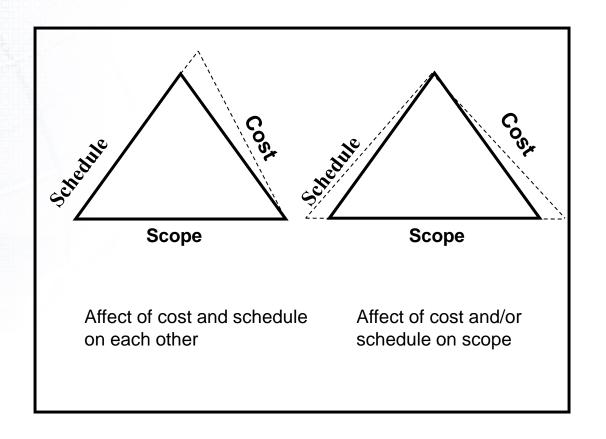

Why Schedule and Cost Control?

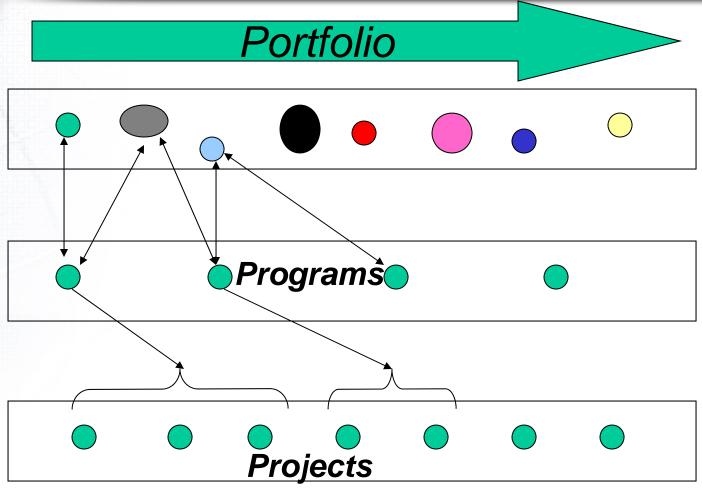

Affect of Schedule, Cost, or Scope Changes

How the Project Fits in the Organization

The Keys to Successful S&CC

- There are six key project management knowledge competences that the successful project manager MUST possess. They are understanding:
 - Requirements interpretation and development
 - Developing good work breakdown structures
 - Developing and interpreting network analyses
 - Developing accurate schedules
 - Developing accurate budgets
 - Implementing and using earned value analysis

Developing Requirements

Basics of requirements development

- Understanding where requirements originate
- Understanding how to determine what is and what is not a requirement
- Understanding types of requirements
 - Functional requirements
 - Non-functional requirements
 - Hidden and generated requirements

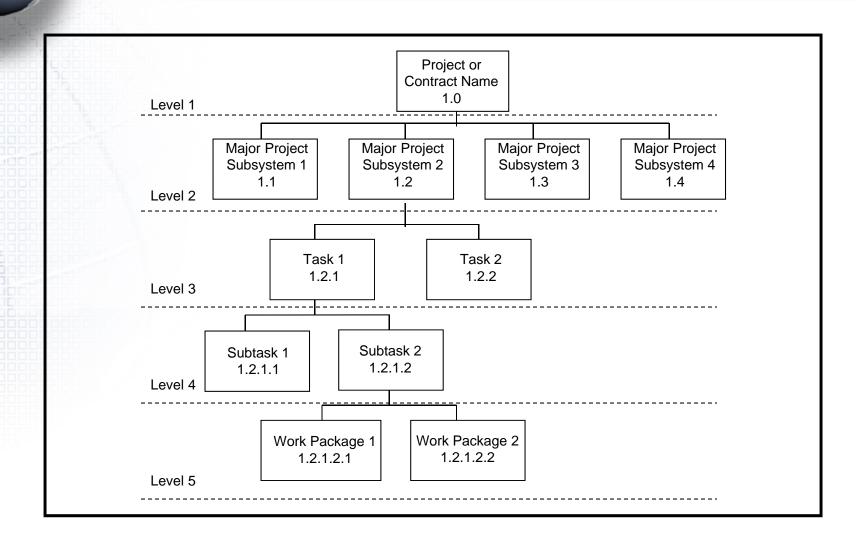

Work Breakdown Structures

There are two ways to display a work breakdown structure (WBS)

- Graphical
- Indented

Example of a Graphical WBS

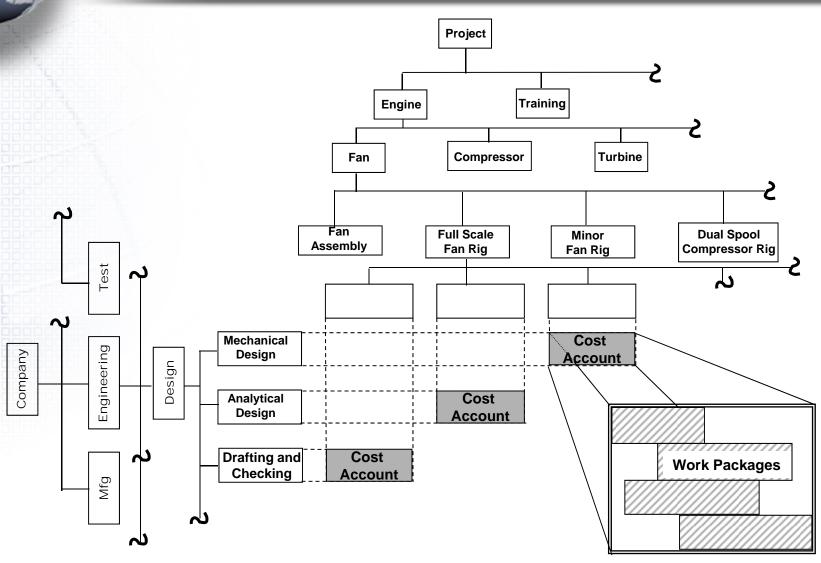

Example of an Indented WBS

- 1.0 Project or Contract Name
 - 1.1 Major project subsystem 1
 - 1.2 Major project subsystem 2
 - 1.2.1 Task 1
 - 1.2.1.1 Subtask 1
 - 1.2.1.2 Subtask 2
 - 1.2.1.2.1 Work package 1
 - 1.2.1.2.2 Work package 2
 - 1.2.2 Task 2

Network Analyses

There are two common network diagramming methods; PERT and PDM

Relationship of WBS to Network Diagramming

Budget Estimate Basics

There are three basic types of budget estimates:

- Rough order of magnitude
- Top down or
- Bottom up or engineering estimate

Cost Categories

The common cost categories and budget terminology of interest to the PM are:

- Direct costs
- Other direct costs
- Indirect costs (general and administrative)
- Fixed costs
- Variable costs
- Sunk costs

Integrating WBS with Work Packages

Earned Value Management—What it is

Earned valued management is the preferred way of monitoring and controlling projects:

- Introduced by the DoD in September, 1968
- Used widely by defense contractors in the 70s and 80s
- Adopted by the private sector in the late 80s
- PMI and most industries consider EVM to be THE method for monitoring and controlling projects

What is Earned Value Management?

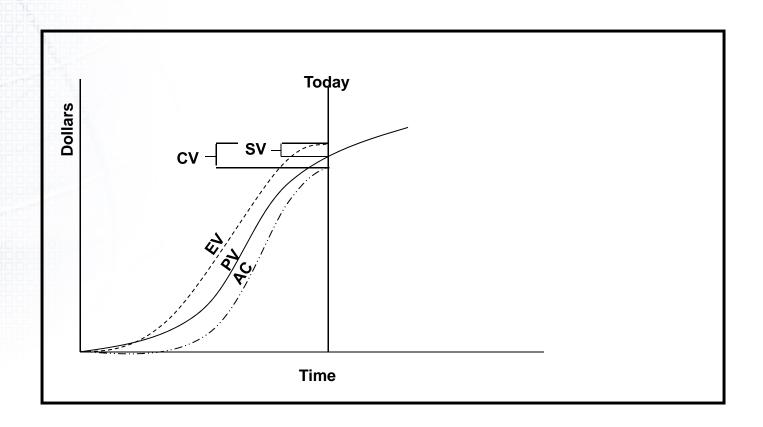

Earned value focuses on three primary components.

They are:

- Planned value—The budgeted cost of the task/project
- Actual cost—The cost that is actually spent during the implementation and development of the task deliverable
- Earned value—The amount earned against the budgeted estimate

The Three Components of EVM

Closing a Project

Two types of audits are required at close out:

- Technical audit
- Financial audit

The practice of Schedule and Cost Control can be summarized by these four project management actions:

- Directing progress
- Directing actions
- Controlling results
- Conserving resources

There are six key project management knowledge competences that the successful project manager MUST possess. They are understanding:

- Requirements interpretation and development
- Developing good work breakdown structures
- Developing and interpreting network analyses
- Developing accurate schedules
- Developing accurate budgets
- Implementing and using earned value analysis
